Anote-"Vector: pBluescript II SK-; Site_1: BCORI; Site_2:
XhoI; This library, constructed by John Davies and Joffrey
KNDErmott, combines constructed by John Davies and Joffrey
MADERmott, combines constructed by John Davies and Joffrey
and-log phase in TAP (acetate-containing) medium in the
light, TAP medium in the dark, HS (minimal) medium in
ambient levels of CO2 and HS medium bubbled with 5% CO2.
POLYA mENA was purified from each sample, pooled and cDNA
synthesized. The cDNA was directionally cloned into lambda
AAP II (Stratagene) in the BCORI (5') and XhoI (3') sites
pBluescript II SK- plasmids were excised from the lambda
AAP clones by superinfection with Exassist (Stratagene)
phage. The library was normalized using method 4 described
in Bonalde et al (1996) Genome Research 6: 791-806."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     BQ818346 1030070C05.yl C. reinhardtii CC-1690, Deflagellation (normalized), Lambda Zap II Chlamydomonas reinhardtii cDNA, mRNA sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δ
                                                                                                                                                                                                               Anote—"Vector: pBluescript II SK-; Site_1: ECORI; Site_2:
XhoI; This library, constructed by John Davies and Jeffrey
MoDermott, combines const from C-1690 cells grown to
mid-log phase in TaP (acetate-containing) medium in the
light, TaP medium in the dark, HS (minimal) medium in
ambient levels of CO2 and HS medium bubbled with 5% CO2.
POlyA mRNW was purified from each sample, pooled and cDNA
synthesized. The CDNA was directionally cloned into Lambda
ZAP II (Stratagene) in the ECORI (5') and XhoI (3') sites.
pBluescript II SK- plasmids were excised from the lambda
ZAP clones by superinfection with Exhasiset (Stratagene)
phage. The library was normalized using method 4 described
in Bonaldo et al (1996) denome Research 6: 791-806."

(normalized), Lambda Zap II"

/note=Vector: pBluescript II Sr.; Site_I: BCORI; Site_2:
Xno1; Deflagellation library, constructed by John Davies
and Jeffrey McDermott, combines CDNAs from CC-1690 cells
which had been re-synthesizing flagella for 15, 30 and 60
min after being deflagellated by pH shock. PolyA mRNA was
purified from each sample, pooled and CDNA synthesized.
The CDNA was directionally cloned into lambda Zap II
(Stratagene) in the ECORI (5') and XNORI (3') sites.
PBluescript II SK- plasmids were excised from the lambda
Zap clones by superinfection with Exassist (Stratagene)
phage. The library was normalized using method 4 described
in Bonaldo et al., (1996) Genome Research 6: 791-806."

The present sequence encodes a human lipocalin homologue, designated alipocalin homologue, alipol, is specifically expressed in tests and mammary gland, particularly breast tumour tissue. Based on this tissue distribution, alipol may be used as a diagnostic for breast carcinomas and as a tool for predicting tumour aggressiveness. Aponists can be used for transportation of small hydrophobic molecules either in vivo or in vitro, and so are useful in specifically promoting the growth and/or development of testis-specific call lineages in culture. Zilpol can be used to identify inhibitors. Zilpol proteins can also be used to prepare antibodies (which can be linked to toxins), and can serve as prepare antibodies (which can be linked to toxins), and can serve as immunogens. Zilpol proteins can be used as delivery and encapsulation system to transport and/or stabilise small lipophilic molecules, e.g. to protect from gut pH and digestive enzymes. They can also be used to protect from gut pH and digestive enzymes. They can also be used to protect from gut pH and digestive enzymes. They can also be used to protect from gut pH and digestive enzymes. They can also should be used to bind strikin, e.g. to transport retinoids or steroids to receptors, in the particular as therapy for breast cancer, emphysema and diseases of the skin. They may also play an important role in reproduction. Other uses include anti-inflammatory responses, and antimicrobial activities.

Zipol uncleic acid sequences may be used for gene therapy to increase or inhibit zipol activity, to derive probes and primers, to derive antisense sequences, and to detect genetic abnormalities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; lipocalin protein; Zlipol; glycodelin; phermone; anxiety; beneficial mood; hypothalamic; satiety; identification; energy balance; reproductive biology; gene; ds.

THE STANDARD STANDARD

ô

```
The invention relates to isolated polynuclectide (I) and conjugetide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome configurerase chain reaction (PGR) primers, oligomers, and for chromosome can gene mapping, and in recombinant production of (II). The configures configures are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for reactor normal activity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques con the configuration a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of states expressing (II). (I) and (II) are useful for treating imaging of states expressing (II). (I) and (II) are useful for treating inapprofice adaption expression or biological activity. The polypeptide and polymuclectide sequences have applications in the printed and to produce other types of data and products dependent on DNA and diagnostic coding sequences. Absolyfe4 represent novel human configuration, but was obtained in electronic format directly from WIPO configuration, but was obtained in electronic format directly from WIPO configuration, but was obtained in electronic format directly from WIPO configuration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 CAGGAGGCCCAGGAAGGTGTCCCCAGTGAAGGTGACAGCCCTGGGCGGTGGGAAGTTGGA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of using two human lipocalin proteins, Zlipol and glycodelin as phermone polypeptides. Human phermones are used to allevate anxiety, promote beneficial moods and to alter hypothalamic functions, such as satiety, energy balance and reproductive biology. The sequences of the invention are used for identifying the presence of Zlipol neceptor in a test sample, or for identifying the presence of a Zlipol ligand or a glycodelin ligand at est sample. The present sequence is human Zlipol DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            76 GGATATCACAGGGACCTGGTACGTGAAGGCCATGGTGGTCGATAAGGACTTTCCGGAGAGA 135

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPID-alpha. OBPS provide long-term retention (gradual ralease) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc.. OBP Polypeptides are used as binding proteins for thydropholic ligands (particularly odorants); as competitive inhibitors (agonists or antagonists) of cellular lipocalcin receptors; to detect specific artibodies for diagnosis of allergy, astume or cancer; for controlling volatilisation of an odorant, specifically in perfumes, cosmetics or disinfectant compositions; to screen compounds, especially controlling volatilisation of an odorant, to binding to OBP, also in analysis of complex perfume mixtures; to solubilise lipophilic compounds; or treatening hyperlipidemia or obesity, or to supplement non-maternal milk when combined with nutritional fatty acids, as food additives; as transporter of pharmaceuticals, especially anticancer agents (providing clayed release) but also for dalivery across the placental harrier of ed-yed release) but also for dalivery across the placental harrier of ed-yed release) put also for dalivery across the placental harrier (e.g. for detorification of the foetus); as a marker of pregnancy or antical as a setting and as a setting as a setting prediction.
                                                                                                                                                                                                                                                                                                                                                                           Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma; cancer; perfume; hyperlipidemia, obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /*tag= a

The BSG sequences are also referred to as breast specific markers (BMS). The invention relates to methods for diagnosing, monitoring, staging, imaging and treating breast cancer (BC). The methods comprise measuring the levels of BSG products in cells, itssues or body fluids of the patient and comparing the measured levels of BSG, with BSG levels of a normal human control. An antibody against the BSC sequences can be labelled and used for imaging BC in a patient. The antibody can be conjugated to a cytotoxic agent, and used for treating BC in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      imaging

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or Knockout animals which are in turn useful for development and secreening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.

                                                                            qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antaqonists are useful for treating and diagnosing immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antaqonists are useful for treating and diagnosing immune related diseateds. The disorders are selected from systemic lupus erythemators, rhemmatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic infiammatory myopathies, Sjogren's systemic vasculitis, sarcoidosis, autoimmune bamolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelharthrop diseases of the central and paripheral nervous systems, hepatobiliary diseases of the central cutoimmune crimmune or immune-mediated skin diseases, allergic disease, autoimmune crimmune-mediated skin diseases, allergic disease, continuent associated diseases including graft rejection and graft-versus-host-disease. AACSB378 represent PCR primers and hybridisation probes used the intelligination of human PRO polynuclectide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rhewmatoid arthritis, osteoarthitis, thyroiditis and diaberes mellitus

                                                                                                                                                                                                                                                Analy22 to Analy144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in Any99340 to Any99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand intractions. The polypeptides and nucleotide sequences encoding them have various industrial applications, including uses as pharmaceutical and diagnostic agents. Analy3145 to Analy330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                  New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                121 AGCCACGTTCACCTTCATGAGGGAGGATCGGTGCATCCAGAAAAATCCTGATGCGGGAA 180

The present invention provides the protein and coding sequences of human pro proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angingenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; angiogenesis; cardiant; cytostatic; antiangiogenic; hypotensive; vulnerary; antiarteriosclerotic; PRO agonist; PRO antiagonist; trauma; gene therapy; cardiovascular disorder; endothelial disorder; cancer; angiogenic disorder; cardiac hypertrophy; atherosclerosis; hypertension; age-related macular degeneration; arterial restenosis; angina; rheumatoid arthritis; myocardial infarction; thrombophlebitis; lumour angiogenesis; breast carcinoma; liver carcinoma; wound healing; chromosome mapping; gene mapping; gene sapping; gene; ss.

The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPIII-alpha OBPS provide long-term retention (gradual clease) of lipophilic compounds, so prolong the 'hold' of perfumes, relacions of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc. OBP polypeptides are used as binding proteins for hydrophobic ligands (particularly) as competitive inhibitors (c) (agonists or antagonists) of cellular lipopalcin receptors; to detect specific antibodies for diagnosis of allergy, asthma or cancer; for confrolling volatilisation of an odorant, specifically in perfumes, cosmetics or disinfectant compositions; to screen compounds, especially odorants or flavours, e.g. human pheromones, for binding to OBP, also in dorant for treating hyperlipidemia or obesity, or to supplement non-maternal milk when combined with nutritional fatty acids, as food additives; as a cransporter of pharmaceuticals, especially anticancer agents (providing delayed release) but also for delivery across the placental barrier (e.g. for detoxification of the foetus); as a marker of pregnancy or comparation of the foetus; as a marker of pregnancy or milallergic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma, cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes

                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABISSO72 to ABLSS258 encode the PRO proteins given in ABBS4817 to
The PRO proteins and polynoleotides have cardiant, cytostatic,
antiangiogenic, hypotensive, vulnerary and antiatreriosclerotic
antiangiogenic, hypotensive, vulnerary and antiatreriosclerotic
activities, and can be used in gene therapy. The PRO polynoclectides,
proteins, agonists and antagonists are useful for treating or diagnosing
a cardiovascular, endochelial or angiogenic disorder in a mammal,
confider hypertrophy, traum, cancer, age-related medular
degeneration, atherosclerosis, hypertension, arterial restenosis,
lymphangitis, tumour angiogenesis (such as breast carcinoma and liver
carcinoma) and wound healing. The PRO polynoclectides have applications
in molecular biology, including use as hybridisation probes, and in
chromosome and gene mapping, ABL88259 to ABL88257 represent primers and
probes used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma; cancer; perfume; hyperlipidemia; obesity; food additive; anticancer; foetus detoxification; pregnancy marker; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPILa-beta. OBPs provide long-term referbition (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc.. OBP polypeptides are used as binding proteins for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes -

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 5

/documber_univor_univor_

/documber_organ: pooled; Vector: pTyT3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not 1; Site_2: Eco RI; Equal amounts of plasmid DNA from thee normalized libraries (fetal lung NbHL30W, testis NHT, and B-Cell libraries (fetal lung NbHL30W, testis NHT, and B-Cell NCI_CGAP_GCB1) were mixed, and ss circles were made in virco. Pollowing Har purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of 1.M.A.G.E. clones 297480-302097, 682632-687239, 726408-7782711, and 722096-713399. Subtraction by Bento Soares and M. Patina Bonaldo. "

transcriptase and subsequently enriched for full-length by captrapper. CDNA went through one round of normalization to Rot = 10.0 and subtraction to Rot = 100.0. Second strand cDNA was prepared with the primer adapter of sequence [5' GARAGARATHTCHATHATHATHATHCCCCCCCCCCCC 3']. CDNA was cloned into the KhoI and BamHI sites. Vector: a modified paluescript KS(+) after bulk excision from Lambda FLC I. Cloning sites, 5' end: Sall; 3' end: BamHI.
